+ + + + + Test leads with new Ø 4mm stackable plug + + + + +

Multi-Contact test accessories stand for safety and reliability, and have proven their worth many times in daily use. Now we have added a new type of test leads to our broad product range.

The test leads XVF/XVS-4075 are equipped with a new Ø 4mm stackable plug. The plug part with lamella, the rear socket and the connection port is a one piece construction offering a particularly low contact resistance. The insulator is designed for safe use up to 1000V, CAT II or 600V, CAT III according to IEC/EN 61010-031. The test leads are pre-assembled with our highly flexible cable with PVC insulation (XVF-4075) or silicone insulation (XVS-4075). Available in various lengths and colours. Thanks to the high cost-benefit ratio of the finished test leads while maintaining the customary high MC quality, the new test leads are particularly attractive for the use in schools and laboratories.

Further information and technical details are published in our new flyer Q Test & Measureline.

The plug part (lamella, rear socket and connection port) is made from one piece.
