

# Press Release

## Your next system provider – Inventux

**Berlin, 21 December 2010 – From exclusive module producer to system provider of micromorph solar technology: Inventux Technologies AG now offers complete solutions for micromorph photovoltaic systems. As of today, the realignment of the Berlin-based solar module producer will also be supported by a completely redesigned website – in five languages!**

Inventux is implementing a consistent diversification and globalisation strategy to meet the challenges presented by constantly changing market conditions. Since the beginning of the fourth quarter, Inventux's product range has been continuously expanded to include ever more intelligently designed and precisely matched system components for micromorph PV systems. In addition to thin-film solar modules, the company also offers convenient mounting systems designed especially for flat roofs, inverters and pre-assembled cables. This allows Inventux to satisfy customer requirements for fully-integrated photovoltaic system solutions and services from one source.

To support this new direction, Inventux's website has once again been adapted to better serve user needs as well as being completely revised. It goes live today. The new site includes not only new product pages, but also comprehensive information and services for Inventux partners at home and abroad. In order to better meet the demand for closer contact with customers outside of Germany, the website, which was formerly only in German and English, is now also available to interested visitors from Italian-, French- and Spanish-speaking countries. After the nonstop expansion of Inventux's international sales team over the past few months, the new website rounds out the services for international markets.

### **About Inventux:**

Inventux Technologies AG not only develops and produces silicon-based thin-film solar modules but is also a system provider of micromorph solar technology. The Berlin-based company was established in the spring of 2007. Just 18 months after launching Europe's first series production of micromorph thin-film solar modules, Inventux was able to increase the efficiency of its modules to 10 percent.

At present, Inventux maintains a staff of some 240 employees and is a winner of the 2010 red dot design award as well as the 2011 iF product design award, among others.
