

## Background Information

### Innovator 11 R4

## Presenting Animated Business Processes with the new Innovator Animator

Animate your process models and, by doing so, revolutionize communication between your operating and IT departments.

### Visualizing Dynamics

Innovator 11 R4 makes dynamics visible. You can only get a limited idea of dynamic flows by looking at static images. That's where Animator comes into play to help you to better determine your process flows.

### Reviews Made Easy

Regular model reviews can help to improve the quality of processes and recognize design errors in good time. Concrete flow scenarios split into various situations can be identified in nested processes and shown in a clear film. Animating flow scenarios makes it easier to understand relationships and relationship dimensions can be intuitively ascertained.

## Better Understanding Between Operating Department and IT Department

All participants can animate process scenarios to get a better understanding of them.

This also facilitates communication between the business analyst who defines and optimizes processes, the operating department which approves

the results and the IT department which develops applications to support this process.

Animation is based on defined paths through the process. Each path can be given a meaningful name that will help to e.g. differentiate the normal flow from a special case and an error. Use this option to make actual complexities a piece of cake for participants.
