***instinctools to Unveil DITAworks at Single-Source-Forum**

***instinctools will open a new horizon in structured documentation by launching its DITAworks on June 22, 2009. DITAworks is a software solution that supports the entire lifecycle of documentation management including modeling, creating and publishing based on its inherent DITA Architecture.**

*instinctools GmbH, a company specializing in Information management solutions and services, is going to launch DITAworks at the 9th German Single Source Forum in Munich on June 22, 2009. DITAworks helps to develop and manage structured documentation like product descriptions, training materials, process documentation, user manuals and online helps. The focus areas of DITAworks' current release are visual modeling, an extended Eclipse documentation package and server side publishing.

*instinctools provides application development and maintenance services for all major Eclipse components, and so it is fitting that Eclipse RCP was chosen as the technological base for DITAworks. Furthermore, special features for documenting Eclipse based applications have been added to the DITAworks solution. Some of these are DITA specialization for defining Eclipse Help deliverables, transformation and validation for Eclipse Help, full support of Eclipse contexts and indexes as well as an IDE plug-in for help context assignment and synchronization with source code. Mike Milinkovich, Executive Director of Eclipse Foundation appreciates *instinctools' latest development and says:

“We are delighted that *instinctools is delivering this innovative technology to the growing Eclipse ecosystem. DITAworks provides a useful tool for creating technical documentation within the Eclipse environment.”

DITAworks follows the motto "DITAworks talks DITA!" and is able to utilize the full potential of the DITA standard because of its 100% native DITA architecture. And the feature which sets DITAworks further apart from other documentation tools lies in its unique and comprehensive modeling functions that allow project-specific

documentation models (DITA Specializations). The complex modeling tasks are made easy with the help of visual editors and wizards. And the definitions of the model thus defined are carried through for further tasks.

DITAworks has plenty of features for making the task of structured documentation easier and more effective. It stimulates the re-use of content according to single source principles by smart implementation of DITA specific possibilities (topics, variables, conrefs). It also improves the effectiveness of documentation planning and creation through comfortable link management and preview functions, wizards for creating objects, and smart editors for topics and maps.

More information on DITAworks and its features is available on the product site:
